K-BAR DESIGN

All K-BARs include the flange-to-inside-wall (FTIW) measurement when determining the length of the probe support.

The K-BAR can be a supported or self-supporting structure.

- A supported K-BAR has an external or internal support cup on the wall opposite the mounting flange. A supported K-BAR allows for a smaller flange and a consistent 1.5" probe support across the width of the stack/duct. A supported probe support with 1, 2, 3, or 4 sensors can be up to 173" (including the FTIW distance).

- A self-supporting K-BAR, depending on the length, can have up to three support probe sections that reduce in diameter toward the probe support tip. In addition, the number of sensors is a factor in determining the maximum probe support length.
 - One segment = 1.5", stack/duct up to 302 inches
 - Two segments = 2.875", 1.5", stack/duct up to 488 inches
 - Three segments = 4.5", 2.875", 1.5", stack/duct up to 460 inches

Note: The additional material used to increase the diameter of segments 2 and 3 also slows the effects of corrosion on the probe support.

HALF SPAN AND FULL SPAN

Using a supported or self-supporting K-BAR is determined by several factors:

- The dimensions of the stack or duct
- The accessibility of an installation location
- The flow profile of the stack or duct
- Excessive vibration

Typical Installation Setup

The KBAR-2000B is designed to work seamlessly with the Series 155 Mass Flow Computer. The Series 155 Mass Flow Computer integrates the functions of temperature and flow measurement, closed loop flow control, flow totalization, sensor dropout correction, alarms, input/output calibration, and data acquisition from up to 22 sensors.
